TITLE: Use of sinter in open-hearth furnace smelting. (Primeneniye aglomerata v martenovskoy plavke). 130 - 6 - 8/27

PERIODICAL: "Metallurg" (Metallurgist), 1957, No.6, pp.17-19 (USSR).

ABSTRACT: Open-hearth ore has been partly or completely replaced
by sinter at the Nizhne-Tagil'sk metallurgical combine

by sinter at the Nizhne-Tagil'sk metallurgical combine since early in 1956. From experimental heats and the statistical treatment of operating data the following main conclusions are drawn: under otherwise similar conditions more sinter is charged than ore (e.g. 8% more for rail steel); more slag is run with sinter than with ore; because of its lower melting point the duration of melting is reduced with sinter to 12-15 min. per heat; the melt-down slag contains more ferrous oxide; the phosphorus content at melt-down is 0.002-0.012% less; the consumption of ore for refining is less because of the more oxidized melt-down slag obtained with sinter; and lime and bauxite consumptions are also less; the rate of carbon removal during the ore boil is less and the duration of finishing is reduced. The reasons for these effects of sinter are discussed and the corresponding quantitative data tabulated. The composition of the sinter was: 58.6% Fe, 19.2% FeO, 62.6% Fe2O3,

Card 1/2

130 - 6 - 8/27

Use of sinter in open-hearth furnace smelting. (Cont.) 0.15% S, 0.047% P, 0.82% Mn, 7.6% Si02, 3.82% CaO, 1.60% MgO, 3.35% $\mathrm{Al}_2\mathrm{O}_3$; it contained 25% of <10 mm fines on charging.

logii martenovskogo proizvodstva stali s primeneniyem kislo-

roda dlya obogashcheniya vozdukha)

PERIODICAL: Byul. nauchno-tekhn. inform. Ural'skiy n.-i. in-t chernykh

metallov, 1957, Nr 3, pp 50-63

ABSTRACT: The experience of the Novo-Tagil Metallurgical Kombinat

in using O2 in its 380-t furnaces is presented. Only magnesite was used to service the furnaces. Charging was performed in from 1 hr to 1 hr 20 min. Melt-down time was significantly reduced. Utmost removal of P is facilitated by running off the slag without keeping it in the furnace. Slags from heats in which O2 is used are characterized by higher basicity. The formation of the slag is accelerated. During the period when the O2 operation of the furnace was being developed, an elevated C % was noted, but all conditions exist to attain a faster

Card 1/2 rate of C burn-off. [Mn] in heats with O2 is somewhat higher

SOV/137-58-7-14367

Open-hearth Procedures With Oxygen-enriched Air

than in heats without O₂. [P] dropped to 0.012% instead of 0.02% in heats without the use of oxygen. The use of O₂ has a favorable effect on [S] although it is the lower, the more rapid the conduct of the heat. The following conclusions are drawn from the experimental heats conducted: use of O₂ increased output per open-hearth furnace by 15.6%; charging-box capacity should be raised from 1.24-1.75 m³. The time required to heat the charge can be reduced to 40 or 50 min. Further increase in output depends upon organizational and technical measures, including an increase in the dimensions of the smelting volume of the furnace.

L 1648-66

ACCESSION NR: AP5021428

was measured at 1000° K and found to be 300 ± 20 mV. The thermodynamic emf E_0 , calculated from data for FeO and SiO_2 , is equal to 797 ± 20 mV. Hence, $t_{ion} = 0.38 \pm 0.03$ for the electrolyte 0.85ThO₂ + 0.15La₂O₃ with the electrodes Si, SiO_2 ($p_{O_2} \approx 10^{-37}$ atm) and Fe, FeO ($p \approx 10^{-21}$ atm), which is close to the value reported in the literature for the electrolyte 0.85ZrO₂ + 0.15CaO for approximately the same conditions. It is concluded that thermodynamic quantities for SiO_2 cannot be obtained by the emf method with a solid electrolyte having oxygen conductivity because an appreciable electronic conductivity arises in the electrolyte, and the galvanic cell ceases to be reversible. Title : A New Method for the Preservation and Storage of the Moist Corn Grain for Foddor (Novyy sposob konservirovaniya i khraneniya vlazhnoge zerna kukuruzy na dorm)

Orig Pub: Molochn, i myasnoyo zhivotnovodstvo, 1957, No 6, 35-39

Abstract: The experiments carried out by the authors demonstrated the possibility of the successful storage of the moist grain of the waxy ripe corn under anaerobic conditions in a storing place isolated from the air and provided with airtight walls. The moisture amounted to about 40 percent. There was but 2-5 percent of mildewed grain.

COVERAGE: This book is one in a series of textbooks prepared by the "Economics and Organization of the Machine-building Department" of the Moscow Institute of Engineering Economics, imeni S. Ordzhonikidze. Part I (Maintenance) is written by N.N. Zakharov, candidate of technical sciences, docent; Part II (Power), by I.M. Kheyster, candidate of technical sciences, docent; Part III (Equipment), by M.S. Murav'yev, candidate of technical sciences, docent; Part IV (Supply) by M.N. Demchenko, dandidate of technical sciences, docent; Part V (Transportation) by M.N. Demchenko, Ya. P. Vecherin, and M.A Sventitskiy. The following aspects are discussed: organization, planning, economics of mainteneance, power, equipment, transportation, warehouses, and the question of supply operations in a machine-building plant.

: Stimulants of Hemosporidiosis in Cattle in Boophilus calcaratus ticks.

Orig Pub

: Tr. In-ta zool. i parazitol. AN KirgSSR, 1956, No 5, 129-134

Abstract

: A study was conducted of hemosporidia morphology of large horned cattle on B. calcaratus ticks collected in a locality open to hemosporidiosis infections. In smears from salivary glands, Malpighian vessels, and ovaries, clubshaped, rhombiod-shaped, round, oval and pear-shaped hemosporidia were found (diameter 2-14). Parasites were found

Abstract

in 4% of tick eggs taken from clinically healthy cows (196 ticks) and from one diseased cow (1 tick). Hemosporidia in these cases had a club-shaped and rounded form (diameter 2-6 \mu). When tick larvae (\sigma 800) were implanted on a healthy cow, the cow became sick and pyroplasms and "fransiella" 7 were found. This confirms that in the southern Kirghiz SSR the vectros of pyroplasm and fransiella in large horned

Title : An Electromagnetic Automatic Pipette.

Orig Pub: Chem. primys], 1957, No 9, 487-489.

Abstract: A pipette (P) for aliquoting equal amounts of solution is provided with a piston which is displaced under the influence of an electromagnet. The time of aliquoting the solution and its removal from the pipette can be regulated and timed to one second, and even to less than one second when the volume of (P) is small. The accuracy of the aliquoting is 0.1% for 10 ml volume. The manipulation can be done by remote control.

with a packing discharger of 100 kilovolts, and work stopped on the variant with storage rings. Originally it was proposed to set up two devices: VEP-1 of 2×130 Mev energy, and VEP-2 of 2×500 Mev energy. The VEP-1 was considered as an actual model of an accelerator and as a device for conducting initial experiments at low energies. After the Panofsky report in 1958 on his work with colliding electron beams conducted in his laboratory at Stanford, construction ceased on 500-Mev storage paths and work was continued on the 2×130-Mev installation. Instead of work on colliding electron beams with energies of 500 Mev, work at the end of 1958 was conducted with colliding positron-electron beams and the planning of the VEPP-2 device was begun, whose main elements are a strong-current electron accelerator and a high-vacuum storage path of 700 Mev energy. At the present time the VEP-1 and VEPP-2 are installed in Novosibirsk. The VEP-1 is in a state of neglect, but at the end of 1964 experiments will be begun with it. Installation of the VEPP-2 has been completed. To obtain a marked effect from the application of colliding proton beams, an accelerator is needed with an energy of at least 10 Gev. Since the ordinary accelerator at such energies is a very bulky machine, it was decided to combine the idea of colliding proton beams with the creation of an iron-less impulse accelerator with very large fields and a neutralized central busbar. This latter work of creating such a machine was reported by the authors at a Moscow conference

held in 1956. The presence of a field with two directions in an iron-less accelerator with central bushar permits the acceleration of protons toward opposite sides in one machine, which makes possible the collision of protons in case of a suitable race-track. At the present time the Institute is developing a proton device with a magnetic field of about 200 kilogauss and radius of 2 meters for a particle energy of 12 Gev in the beam (equivalent energy is around 300Gev). Tests are being conducted on models, and an effective method of injection by overcharging of negative lons is under study. Also under development are an impulse electric power supply aystem of 100 million joules capacity and an hf power supply. Since 1958 the Institute has been conducting theoretical investigations on the limits of applicability of quantum electrodynamics [V. N. Bayyer, ZhETF, 37, 1490 (1959), and UFN, 78, 619 (1962)] for the calculation of the radiational corrections to the electrodynamic cross-sections [V. N. Bayyer and S. A. Kheyfets, ZhETF 40, 613-715 (1961) and Nuclear Physics (in print)], and on other problems of high-energy particle physics that are connected with the preparation of experiments on colliding beams [V. N. Bayyer, I. B. Khriplovich, V. V. Sokolov, and V. S. Synakh, in ZhTF, 1961]. The present report takes up under the mentioned three main headings the following pertinent topics: the accelerator-injection, storage paths, electron-optical channel,

because of its simplicity, to carry out a sufficiently complete analysis of all the main properties of nonlinear focusing. In this model a symmetrical magnetic field is used whose series expansion contains r and z powers not higher than the fifth. The simple model has even in the first approximation a perturbation theory one r-z. resonance in the center of its stability region. The dimensions of the first region of stability are evaluated with allowance for small z-oscillations. It is established that mutual phase stabilization cocurs in the region of the r-z resonance. A numerical and partially analytic investigation of these effects is briefly presented. The calculations of the simple model confirm the main concepts of the theory. THE STREET SECTION OF THE SECTION OF

TITLE: Spores of microorganisms. 15. The alteration of heat sensitivity and its relation to the radiation resistance of bacterial spores

SOURCE: Folia microbiologica, v. 9, no. 4, 1964, 238-248

TOPIC TAGS: radiation resistance, microbiology, bacteriology, bacterial spore, bacillus, thermal resistance, dipicolinic acid, calcium, x ray, ultraviolet ray, tetracycline, cysteine

ABSTRACT: The addition of different concentrations of cysteine or thioproline (1·10⁻⁴ to 5·10⁻⁴ M) to the culture at the onset of formation of Bacillus cereus prespores, that is, before commencement of dipicolinic acid synthesis, led to the death of some of the cells and injured the thermoprotection mechanism of the surviving spores. In control spores with a high dipicolinic acid content, inactivation by heating at 85C was preceded by a lag phase, while in cysteine-

Card_ 1/2

ACCESSION NR: AP4042610

and thioproline-treated spores this lag phase was completely absent and the death rate of most of the spores (D-value = 17) was actually higher than the final death rate of the control spores (D-value = 33). A small proportion of the treated spores in the inhibited cultures (less than 10%) displayed almost the same heat resistance as untreated spores. The heat sensitivity of treated spores was greater than might have been anticipated from their dipicolinic acid content. Their resistance to x-rays was not reduced, but actually increased. The results are discussed with reference to the differentiation of a possible "basal" and "additional" spore thermoprotection mechanism and to differentiation of the nature of heat and radiation resistance in bacterial spores. The experimental results are presented in 5 graphs. Orig. art. has: 5 figures.
